Frequency of CTs

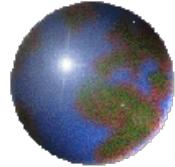

- ❖ we studied seasonal linear trends in the frequency of CTs in 1957-2002 in all catalogues from cat.1.2, all domains
- ❖ total number of CTs > 55,000
- ❖ comparison of objective and subjective catalogues
- ❖ related issues
 - ❖ different number of CTs in individual catalogues
 - ❖ in each catalogue, season, and domain, we were looking for the CTs with trends significant at the 95% level
 - ❖ different overall occurrence of individual CTs – how to compare the resulting trends?
 - ❖ thus we calculated the percentage of DAYS occupied by CTs with significant trends in frequency

Frequency of CTs

Percentage of days occupied by CTs with significant trend in frequency
in selected domains

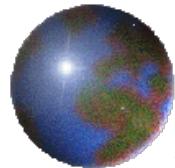

Frequency of CTs

Magnitude of significant trends in the frequency of CTs in GWTC10
(days per season in 1957-2002)

Frequency of CTs

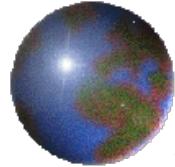

Seasonal frequency vs. magnitude of significant trends in frequency of CTs in Central Europe (D07)
Results from all objective and all subjective classifications

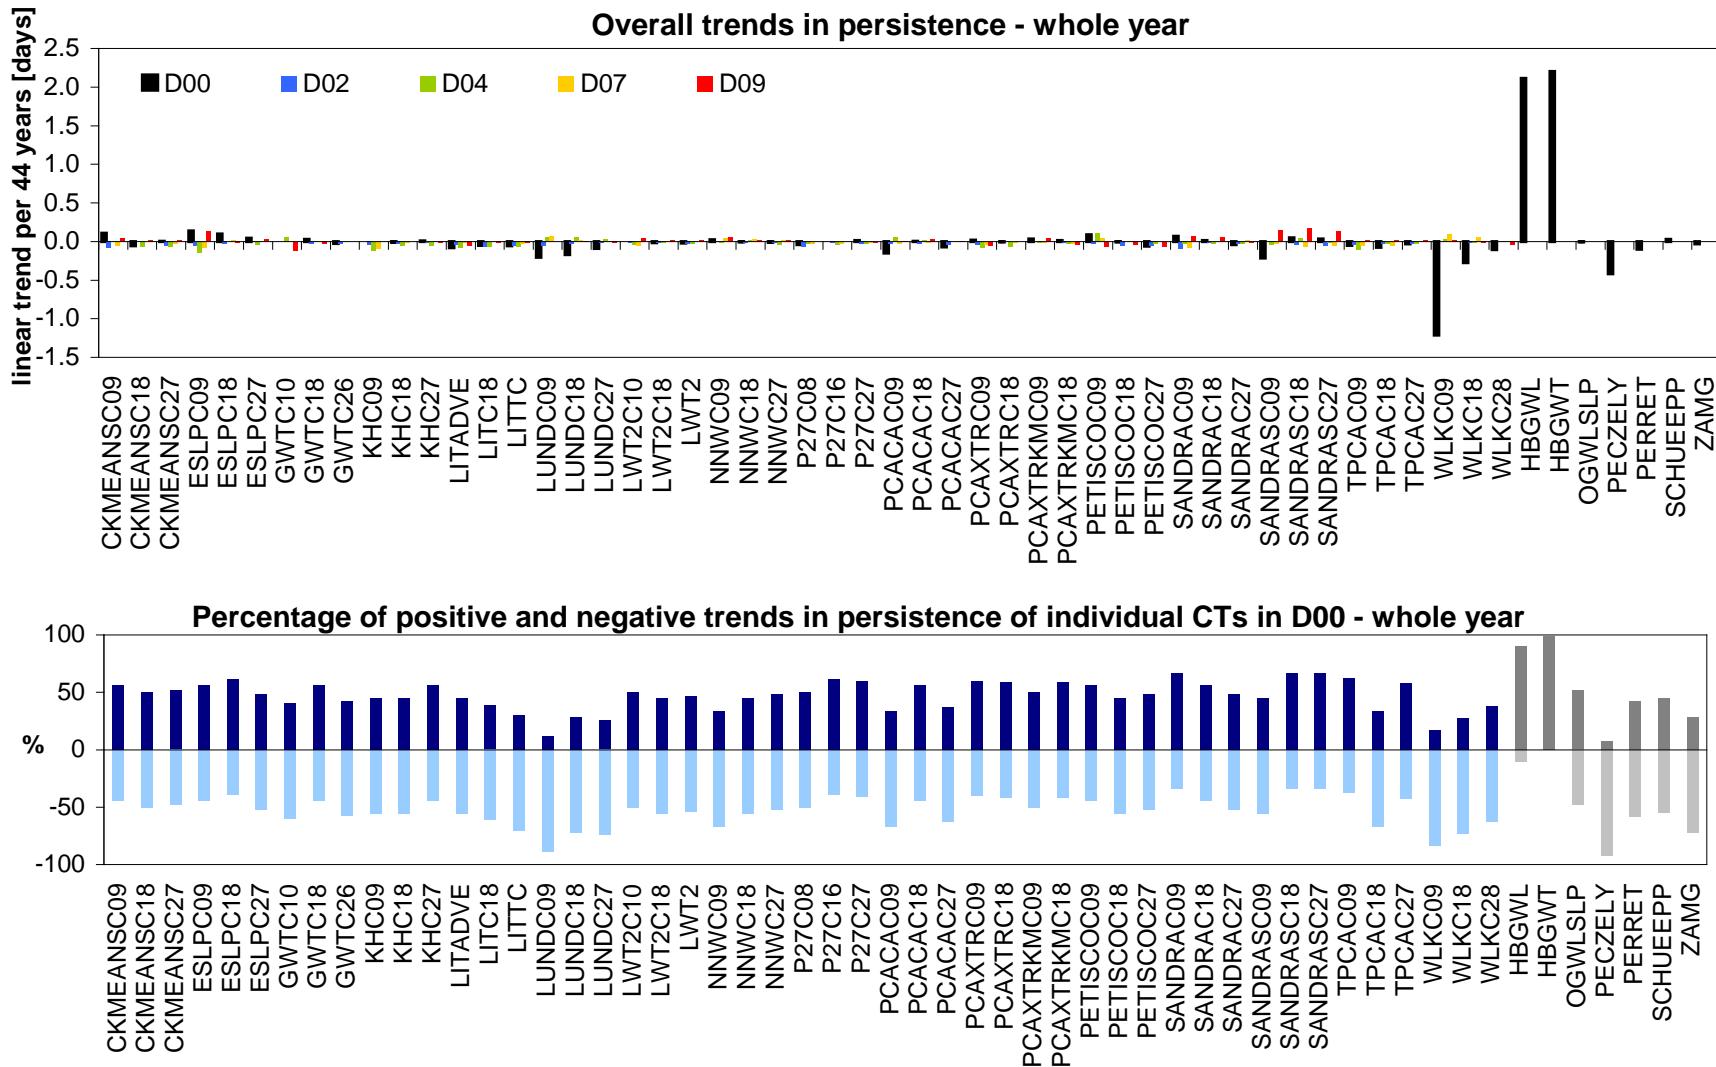

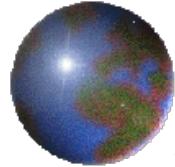

Persistence of CTs

- persistence = length of sequence of days classified with one CT
- Hess-Brezowsky: sudden increase in persistence in the mid-1980s – is it real or is it just an inhomogeneity?
- COST733 catalogue version 1.2, domains 00, 02, 04, 07, 09
- additional: OGWL with a minimum 3-day duration of CTs (...thanks to Paul James)
- applied statistics:
 - long-term persistence of individual types and all types combined
 - time series of annual persistence
 - linear trends of persistence
 - correlation of time series of persistence between pairs of classifications

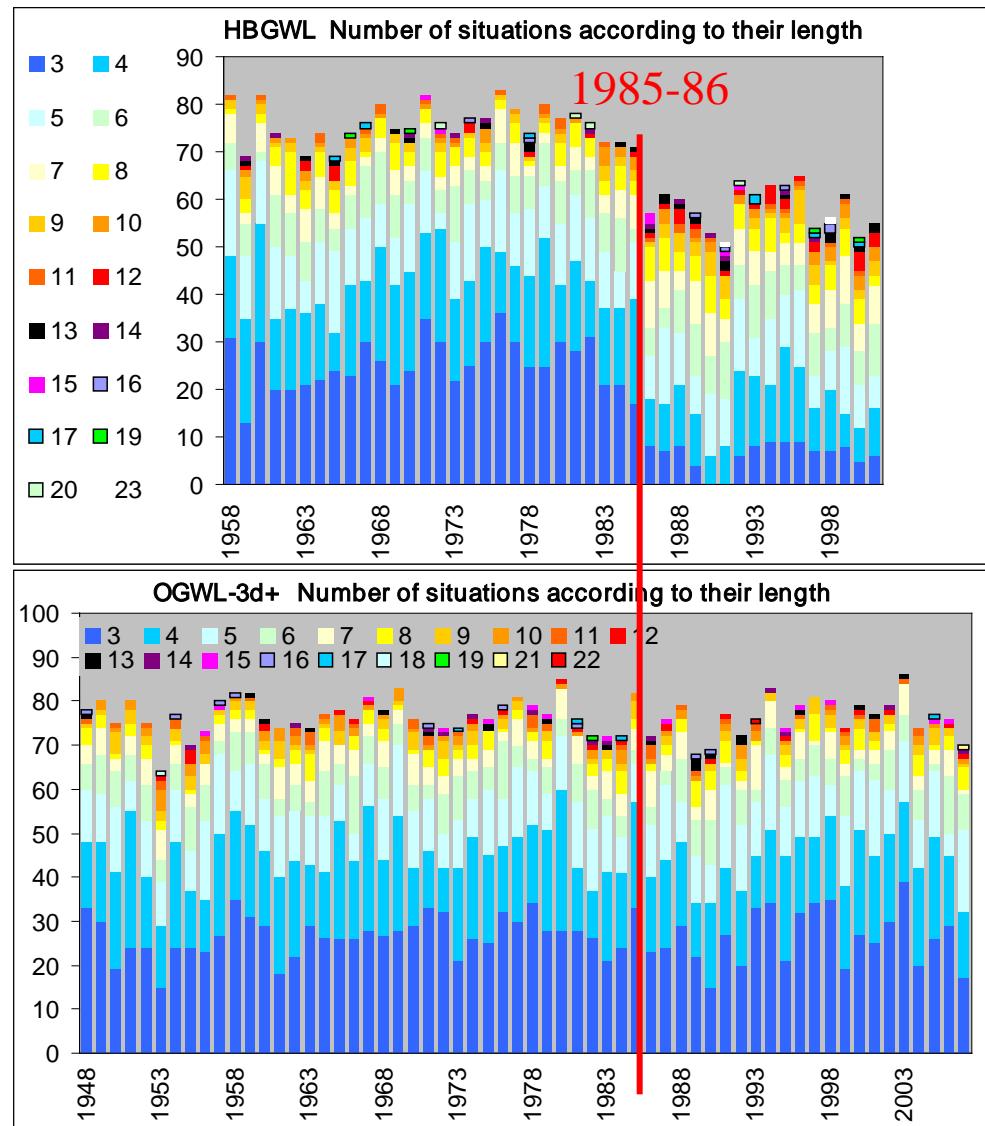

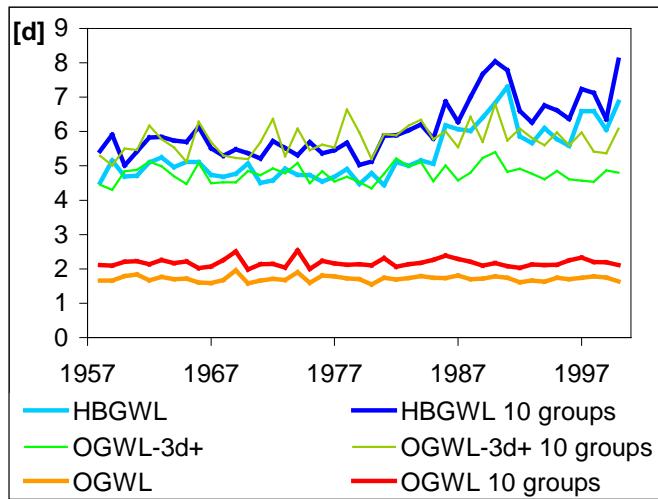

Persistence of CTs

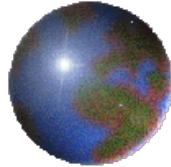

Persistence of CTs

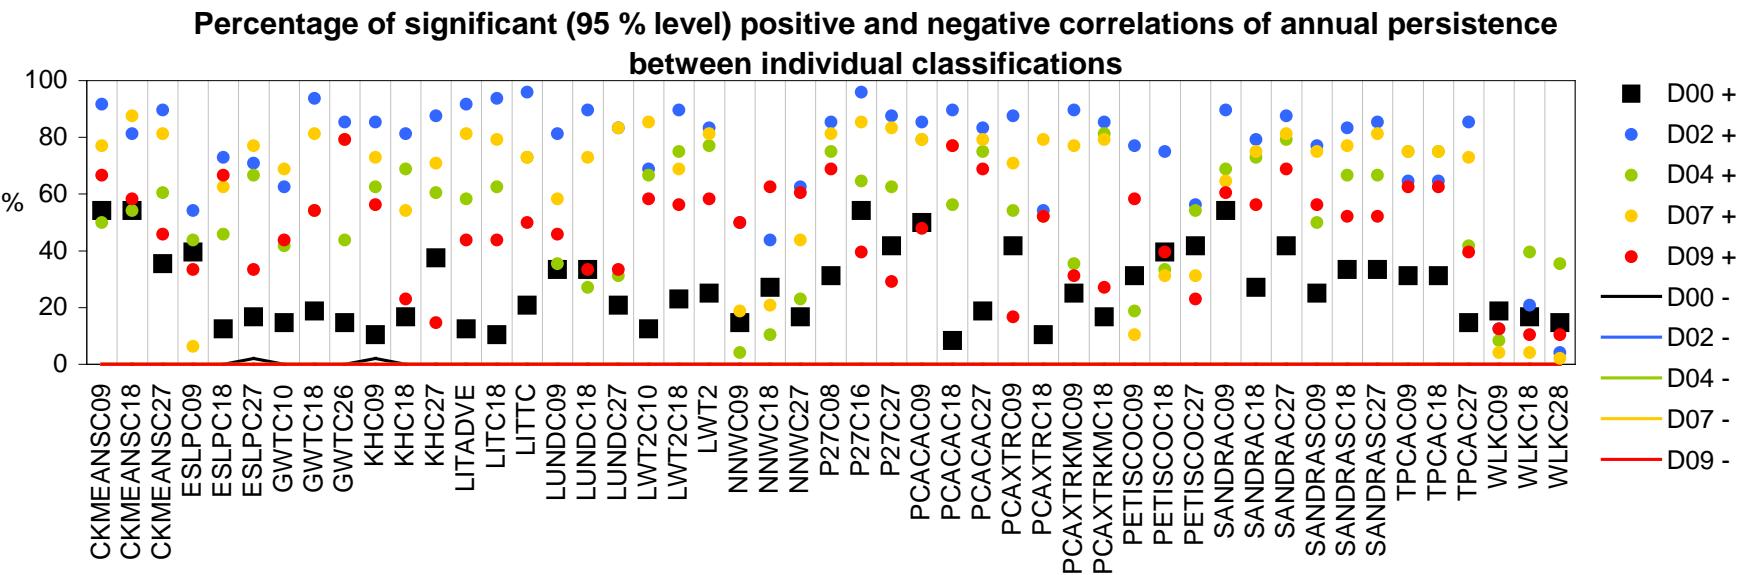

- the sudden increase in persistence in the Hess-Brezowsky in the mid-1980 is most probably an inhomogeneity
- it it caused by vanishing 3-day events

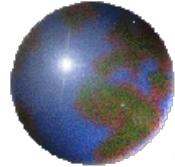

Persistence of CTs

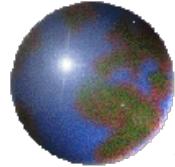

- Do individual classifications share a common long-term pattern of year-to-year changes in persistence?
- correlation of time series of annual persistence between pairs of classifications

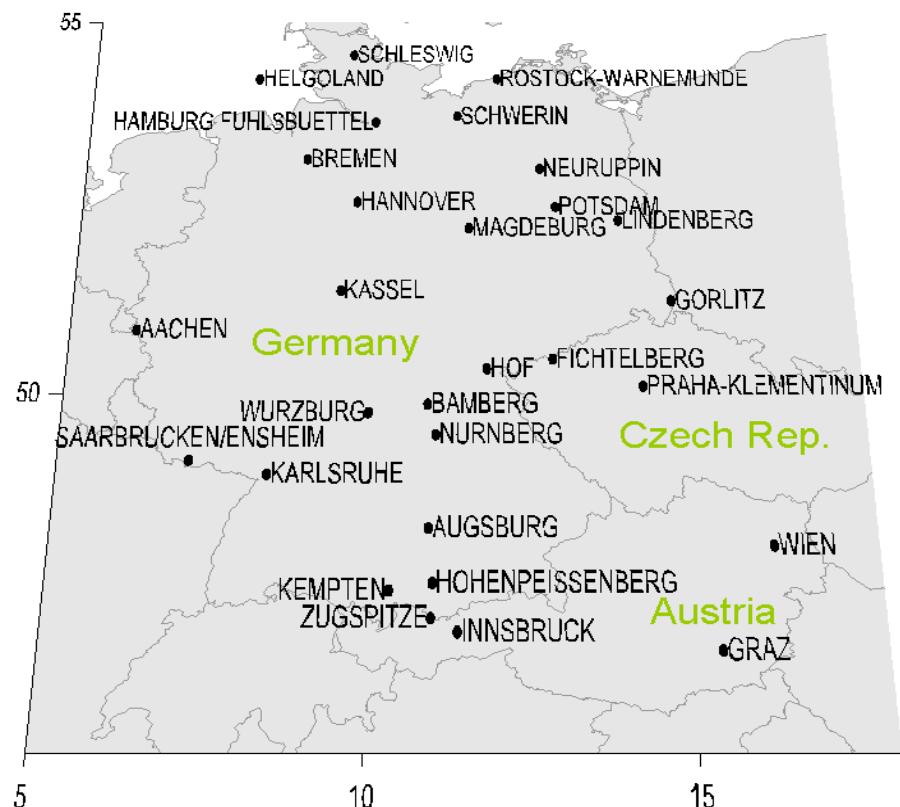

Persistence of CTs

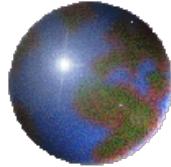

- ➊ Persistence vs. temperature anomalies: *Kyselý (2007)* and *Kyselý and Huth (2008)* found that persistent CTs are conducive to heat and cold spells, and hypothesized that the increase of persistence could lead to an increased severity of temperature extremes
- ➋ Now that we know that persistence is not rising, should we still be afraid of these extremes?
- ➌ We revisit the topic of warm CTs in summer in Central Europe, comparing the Hess-Brezowsky with its objectivized version OGWL3 in the period 1961-2000

Persistence of CTs

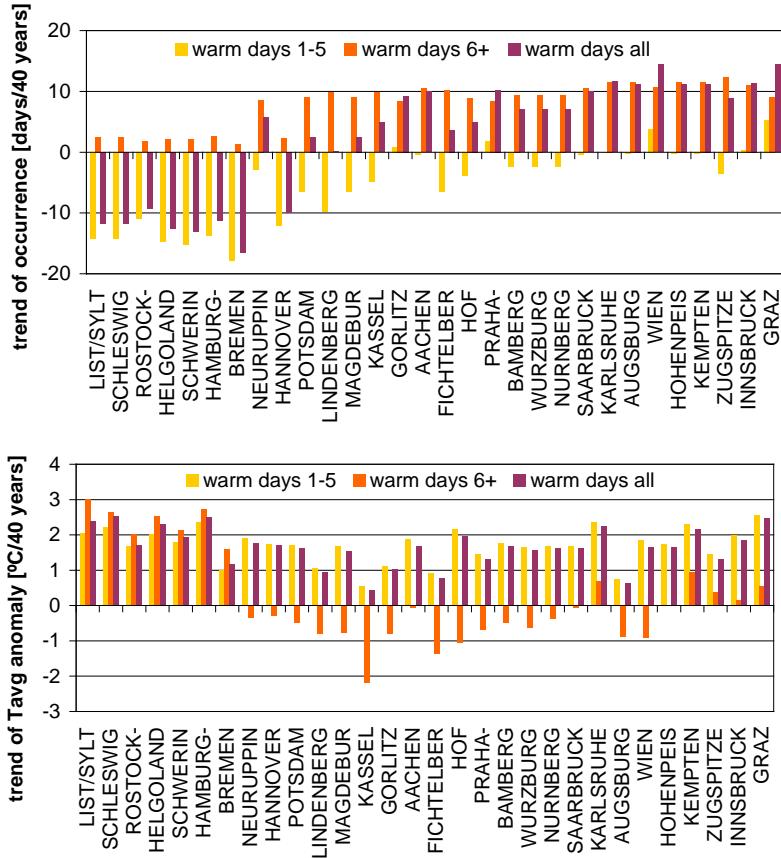

- ❖ Warm CT: mean Tavg anomaly > 1 deg.C
- ❖ Trends in frequency and temperature anomaly of early stages (days 1-5) and late stages (days 6+) of CTs
- ❖ We found major differences between HBGWL and OGWL3
- ❖ Most of the warm CTs are warmer during their late stages
- ❖ Different individual CTs act as “warm CTs” in different parts of the study area

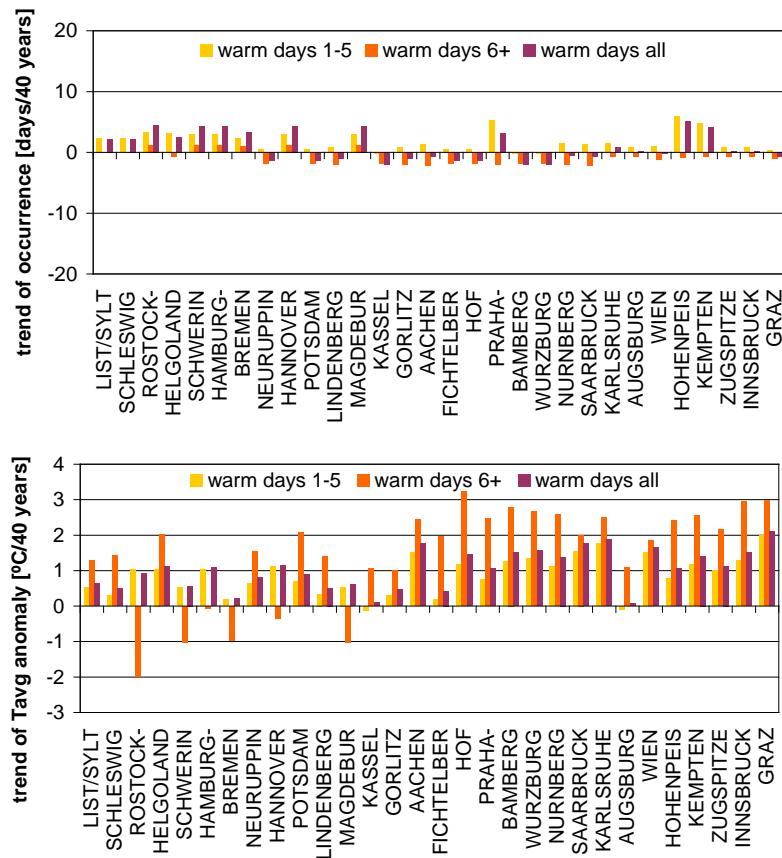

Persistence of CTs

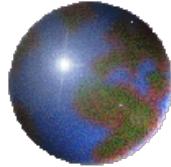

HBGWL

OGWL3

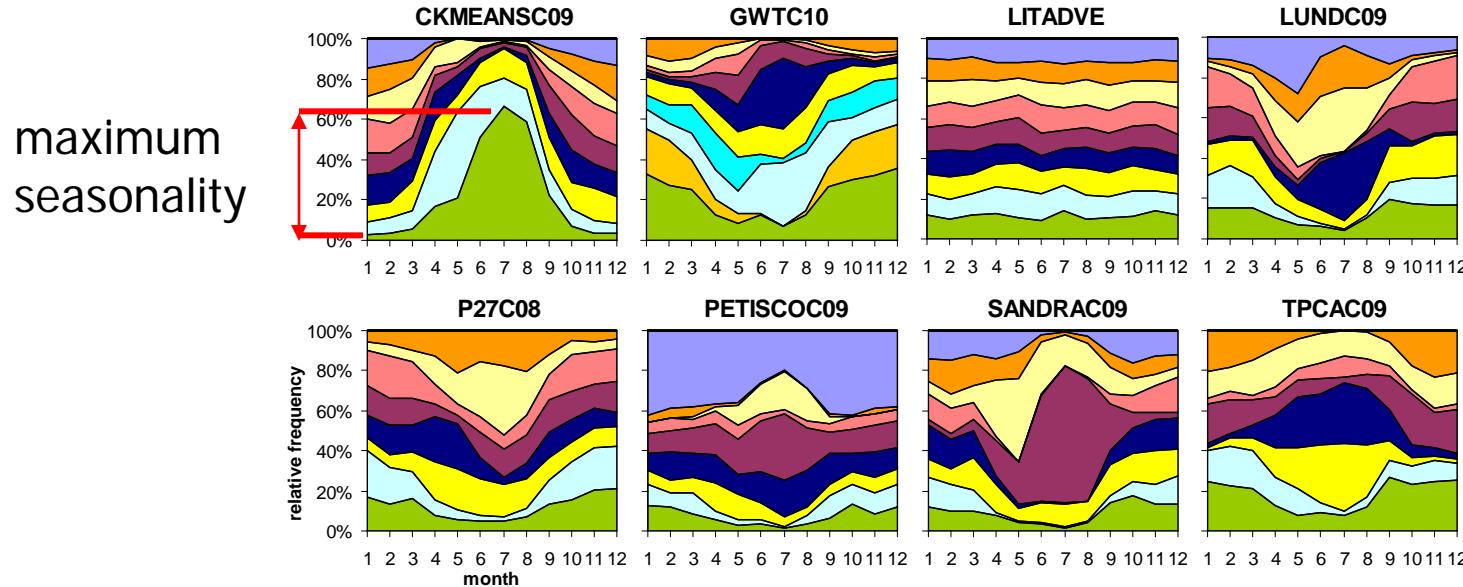

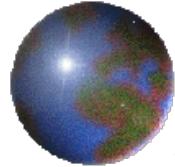

- Under HBGWL, warming of warm CTs is caused mainly by rising persistence
- Under OGWL3, warming is caused mainly by within-type temperature trends

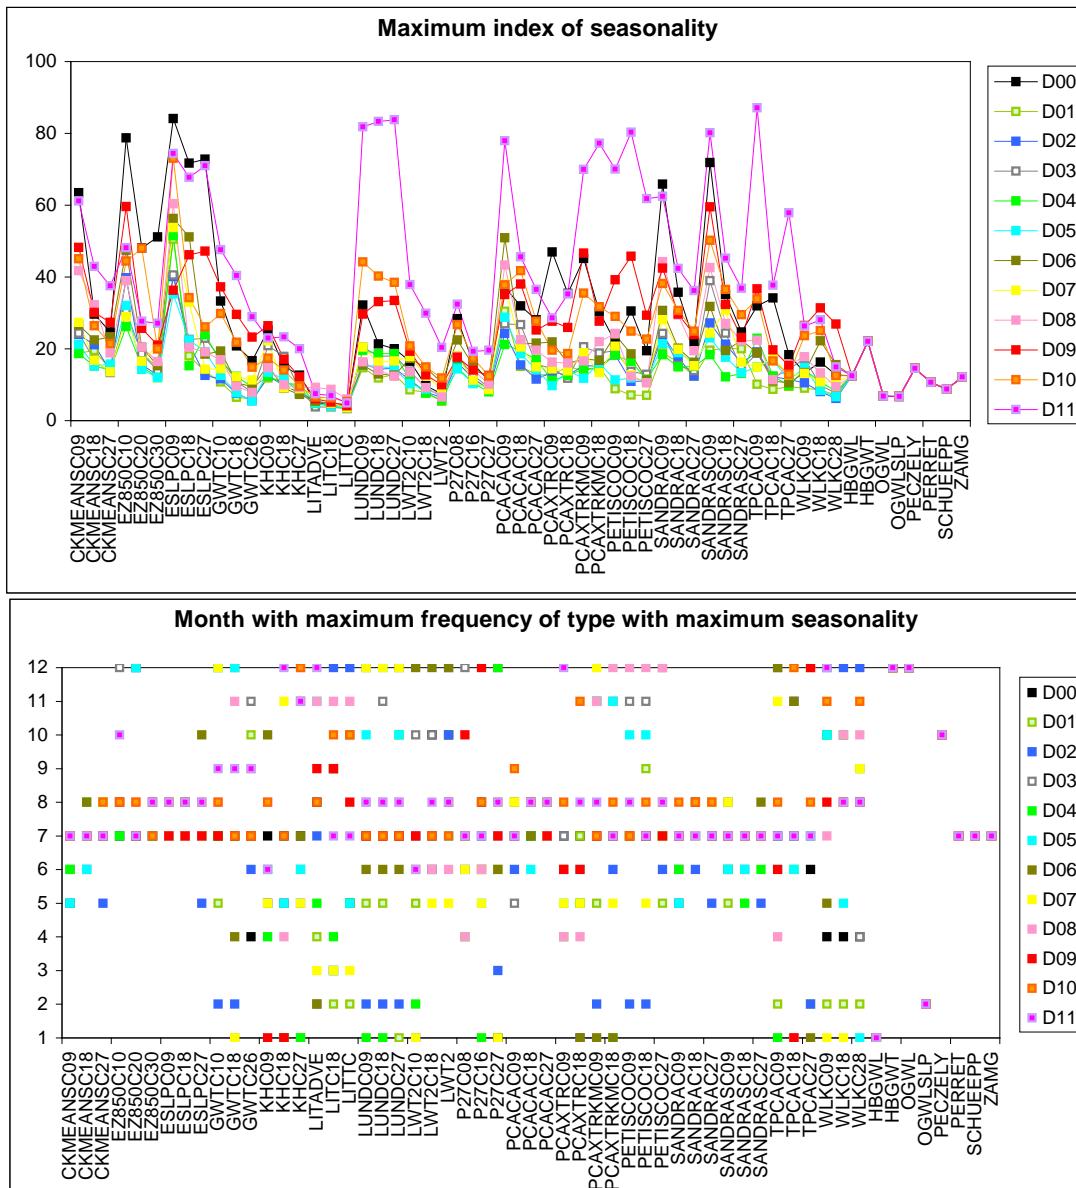

Seasonality of CTs

- comparison of classifications according to the seasonal (monthly) relative frequency of CTs
- we have developed several simple indices of seasonality based on monthly relative frequency of CTs
- Do individual classifications share a common long-term pattern of year-to-year changes in the seasonal variations of atmospheric circulation?

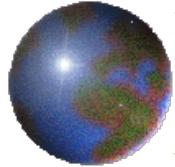

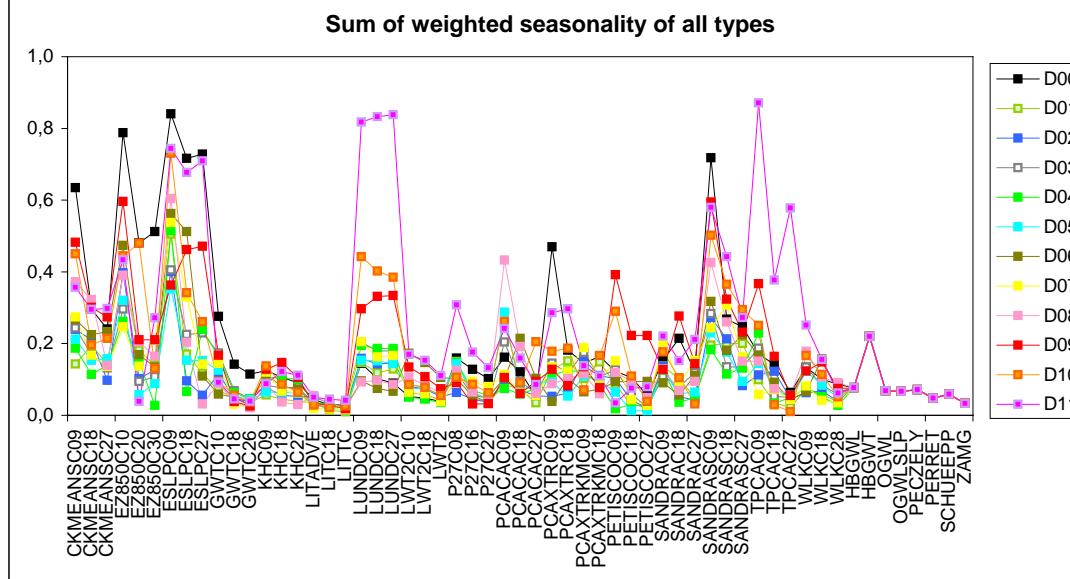

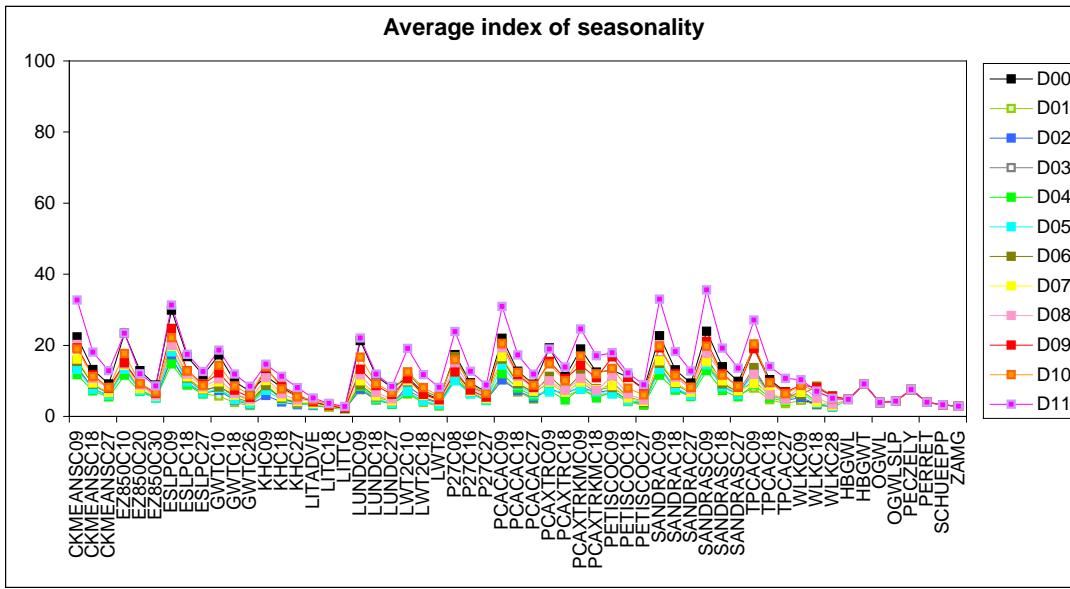

Seasonality of CTs

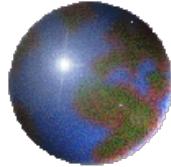

seasonality
of the most
seasonal CT

Seasonality of CTs

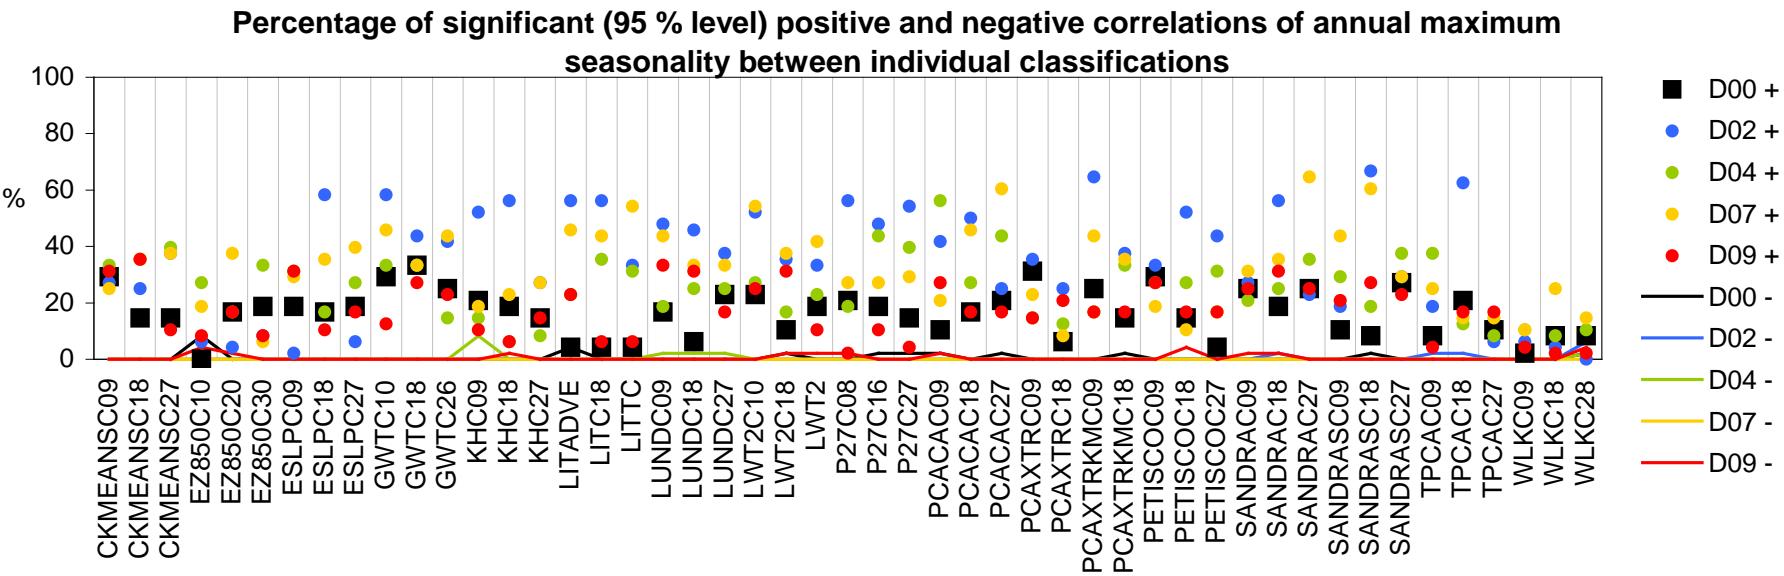

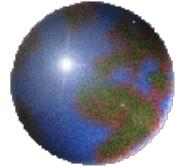

seasonality
of each CT is
weighted by
its overall
relative
frequency

Seasonality of CTs

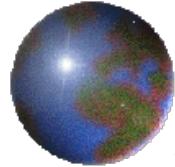

- Do individual classifications share a common long-term pattern of year-to-year changes in the seasonal variations of atmospheric circulation?
- correlation of time series of maximum seasonality index between pairs of classifications

Conclusions

- ⊕ Systematic circulation changes in the ERA-40 period were only found in winter
- ⊕ These reflect the strengthening of the NAO
- ⊕ Persistence of CTs does not bear any systematic trends
- ⊕ The Hess-Brezowsky catalogue is biased in terms of persistence
- ⊕ Long-term variations of persistence and seasonality are not uniform in the individual classifications
